Disk File Systems

- Volume

- a partition that contains a file system

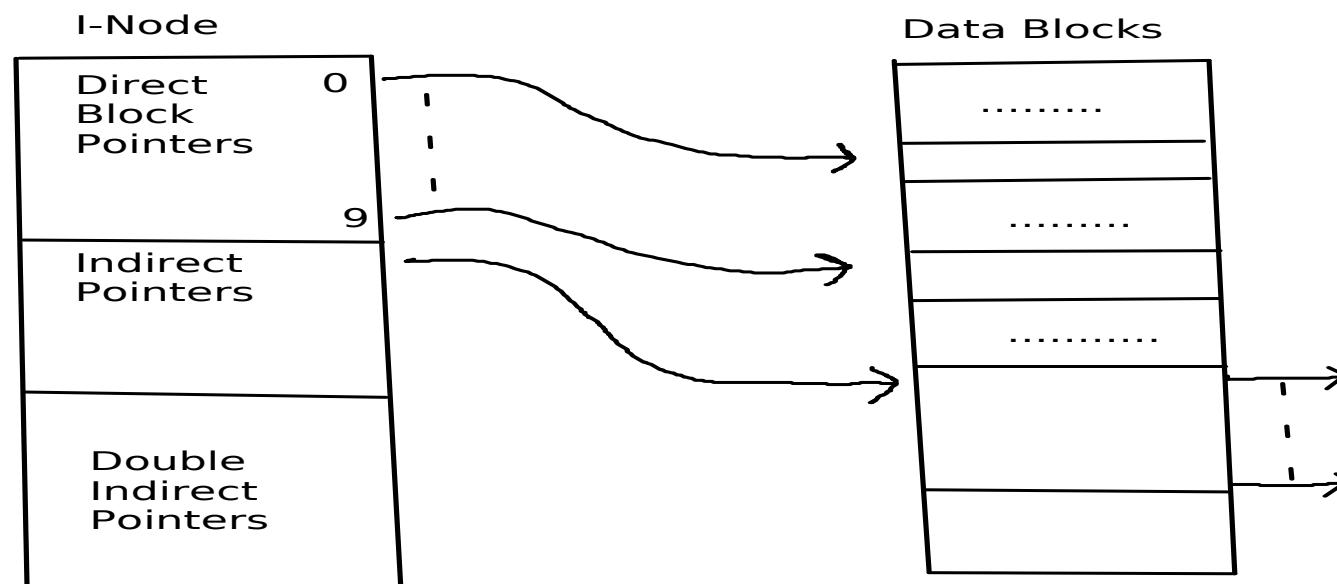

Disk File Systems cont.

- Boot Block
 - contains information needed to boot an OS located on the volume (should one exist)
- Superblock
 - balance sheet for the file system meta-data
- Free Space Map
 - a bit-map where each bit is used to indicate whether a particular "object" is free or in-use
- I-Node Table
 - data structure with entries that hold meta-data for a particular file
- Data Blocks
 - hold file and directory data

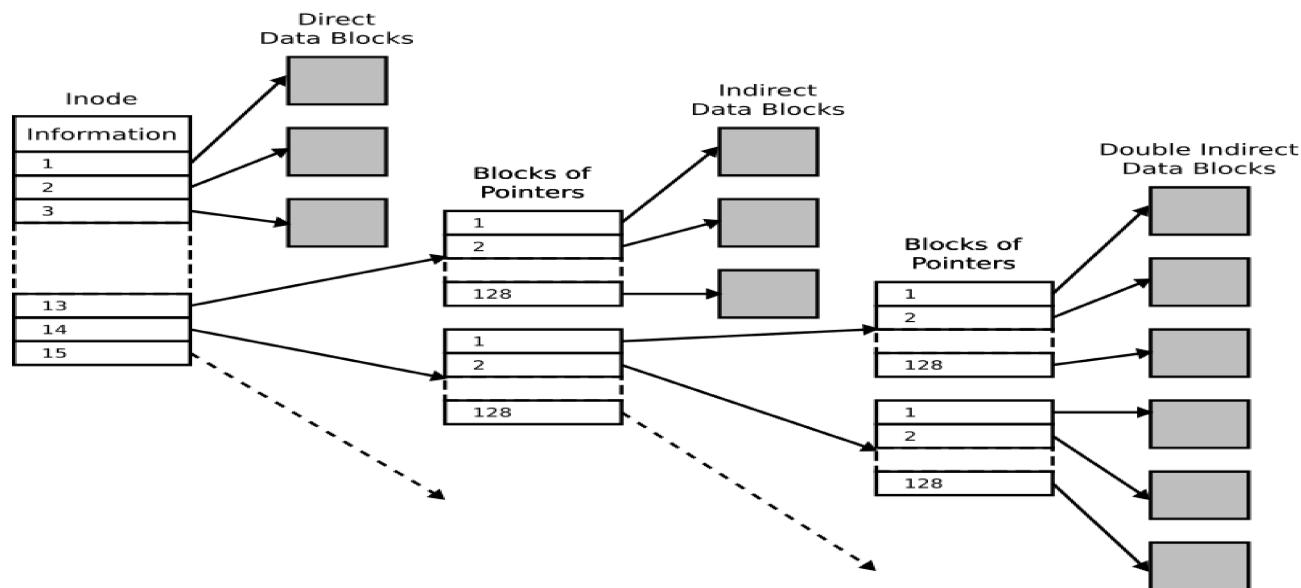

I-Nodes

- I-Node Table
 - array of fixed length I-Nodes
- I-Node Number
 - index into the I-Node Table

I-Node Pointer Structure

- [https://en.wikipedia.org/wiki/Iinode_pointer_structure](https://en.wikipedia.org/wiki/Inode_pointer_structure)

Data Blocks

An I-Node can reference three types of data blocks.

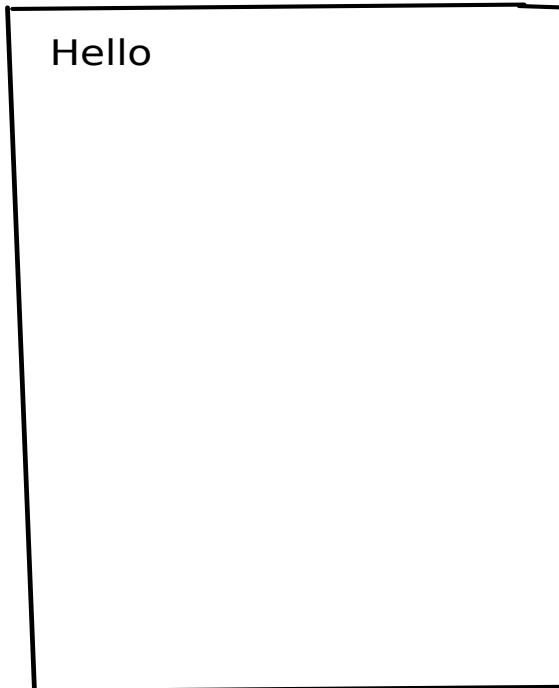

- Data Block Types
 - Plain Data
 - Directory Data
 - Symbolic Link Data

Plain Data Blocks

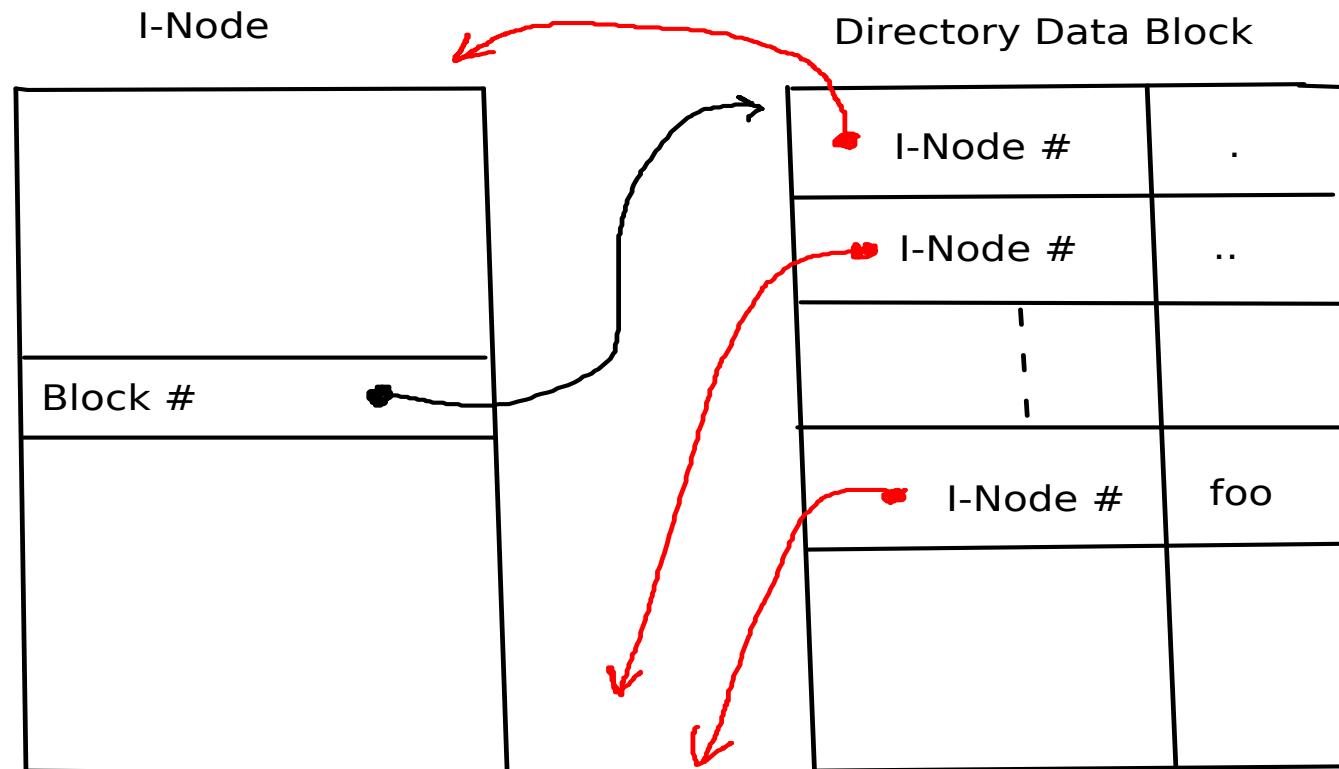

I-Node

Plain Data Block

Directory Data Blocks

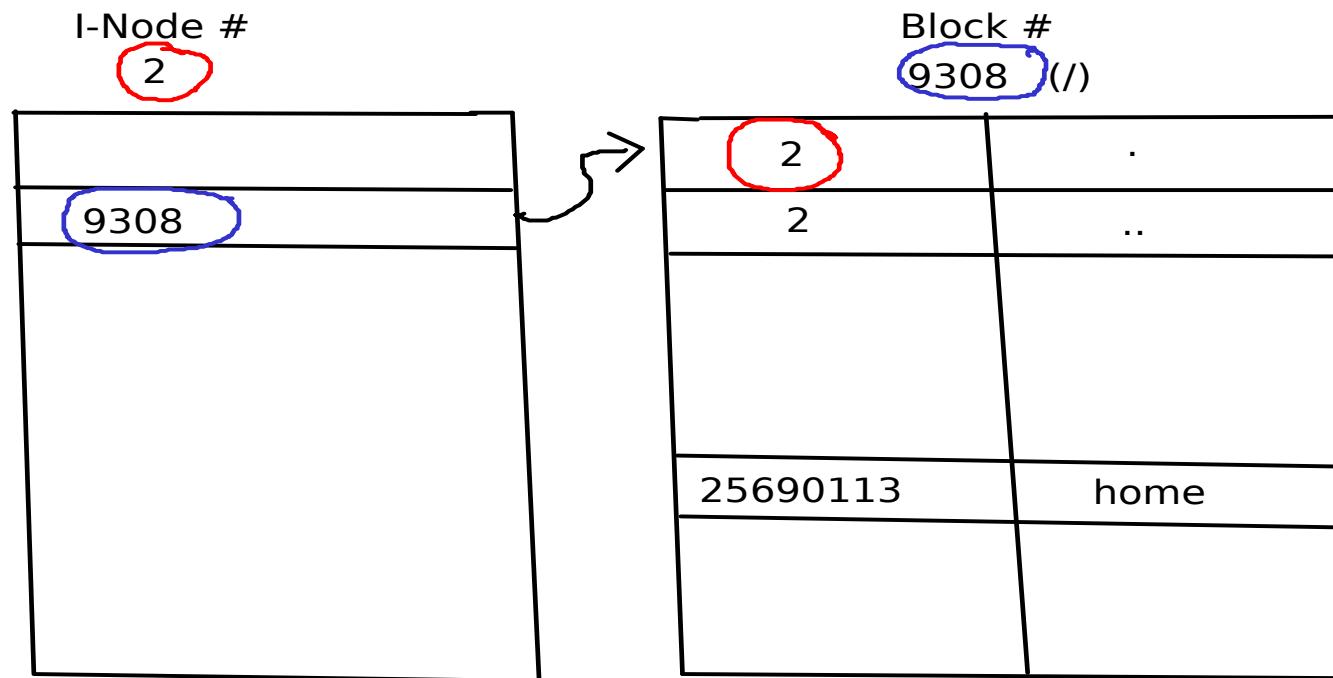

Access `/home/peter>HelloWorld`

- the kernel knows the I-Node number of the root directory and the current directory (`pwd`)
- the kernel fetches from I-Node 2, the pointer(s) to the Data Block(s) for the root directory
- the kernel searches the Data Block(s) for `home` and extracts its I-Node number n
- the kernel fetches from I-Node n , the pointer(s) to the Data Block(s) for the `/home` directory
- the kernel searches the Data Block(s) for `peter` and extracts its I-Node number m
- the kernel fetches from I-Node m , the pointer(s) to the Data Block(s) for the `/home/peter` directory
- the kernel searches the Data Block(s) for `HelloWorld` and extracts its I-Node number o
- the kernel fetches from I-Node o , the pointer(s) to the Data Block(s) for the file `/home/peter>HelloWorld`

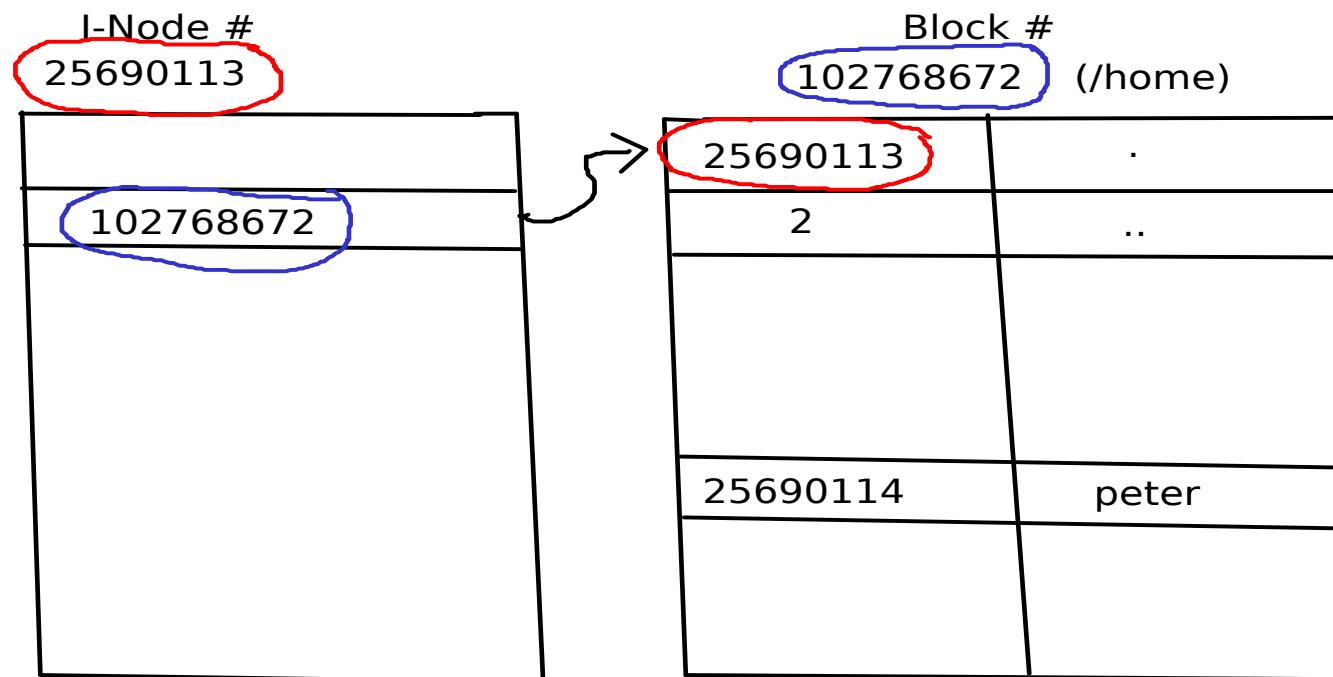

Access /home/peter/HelloWorld

- Root I-Node

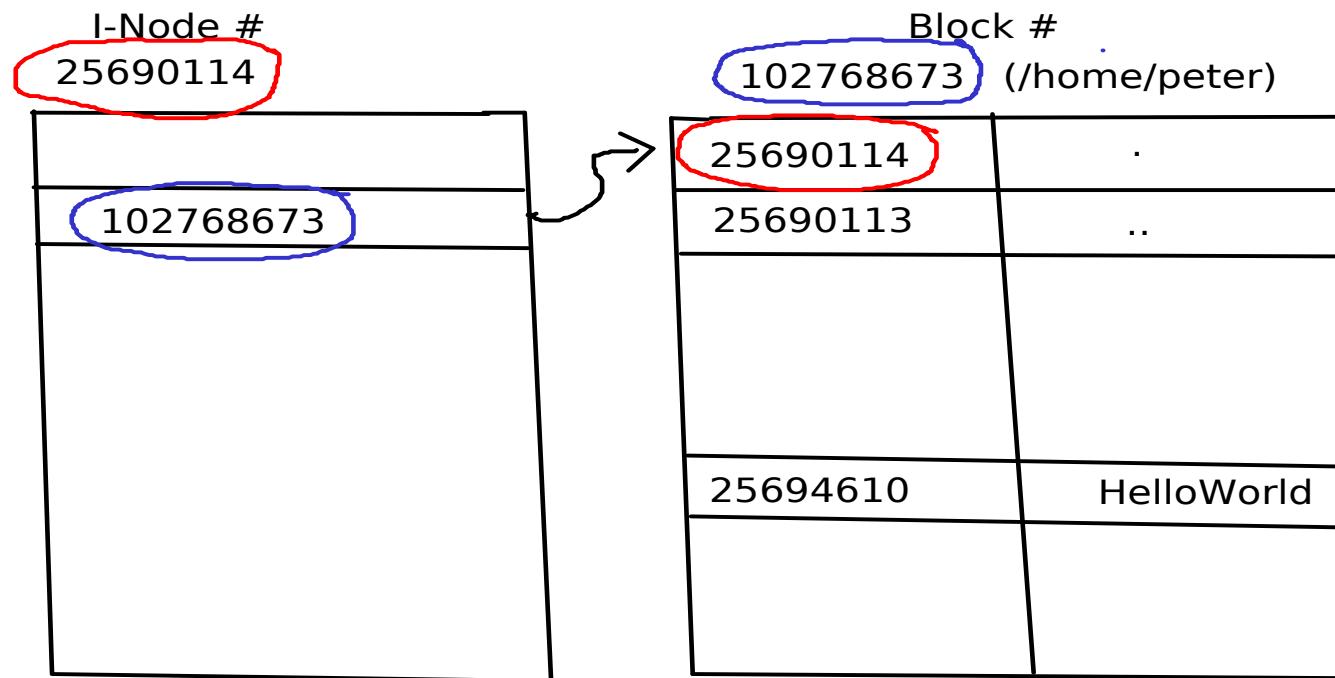

Access /home/peter/HelloWorld cont.

- /home I-Node

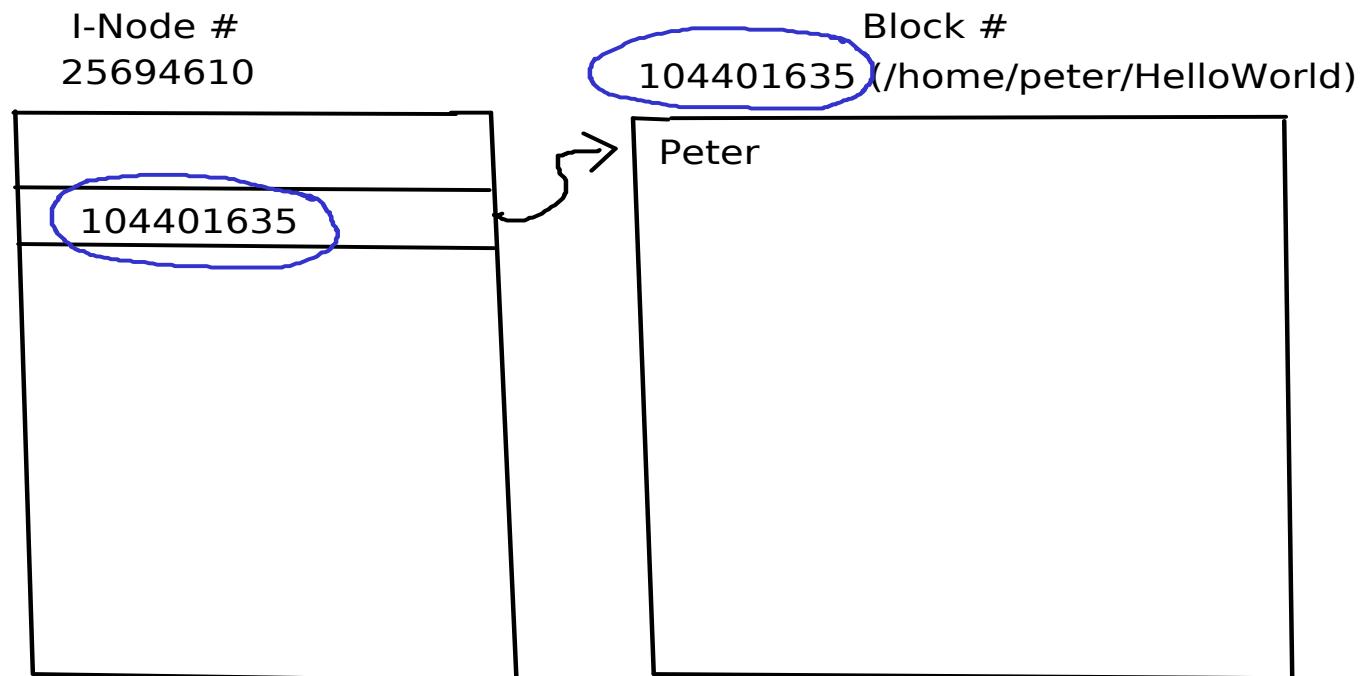

Access /home/peter/HelloWorld cont.

- /home/peter I-Node

Access /home/peter/HelloWorld cont.

- /home/peter/HelloWorld I-Node

Debug File System

- Enter Debug Shell (`debugfs /dev/sda5`)

- `debugfs: stat /`

Hard File Links

- two files that share the same I-Node

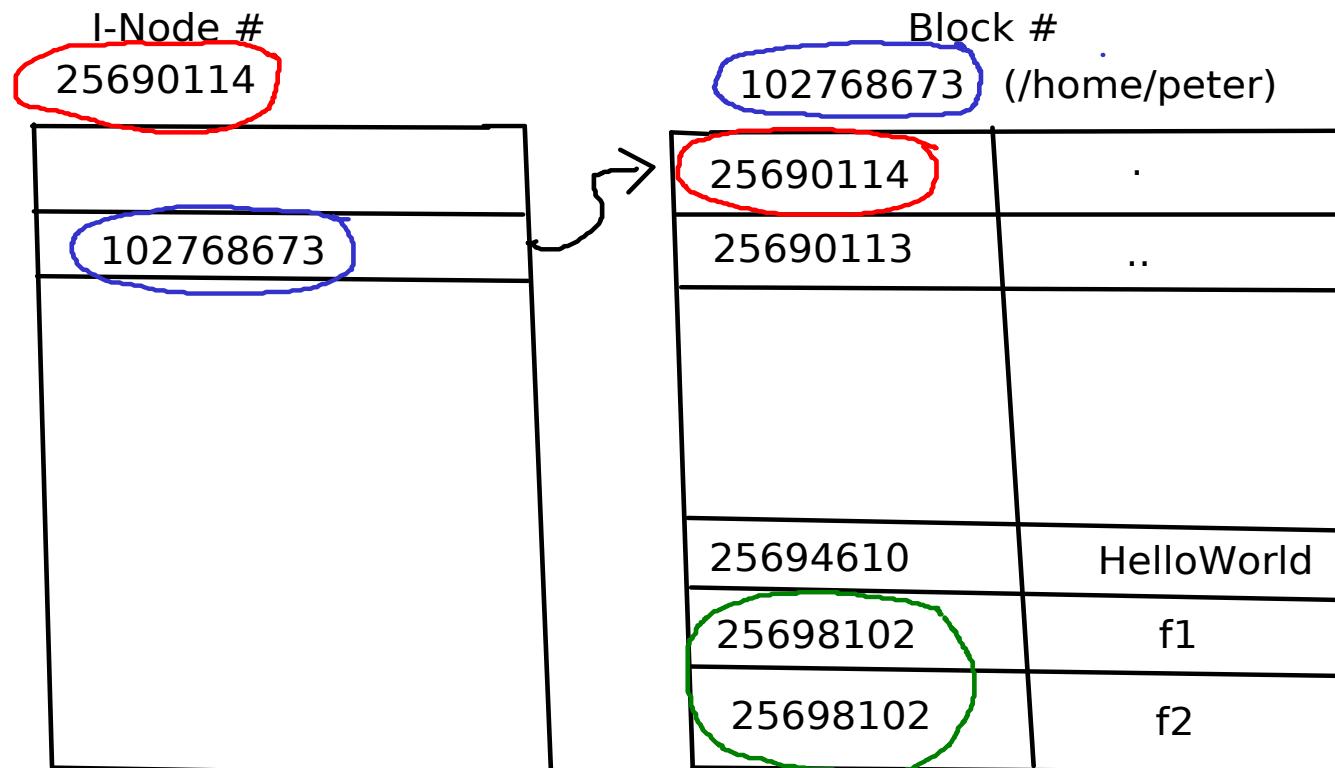

```
# Assume ext4 file system on /dev/sda5  
# (Root File System)
```

```
peter@cobra:~$ echo "Peter Again" > f1  
peter@cobra:~$ ln f1 f2
```

- modifications to f1 are reflected in f2 and vice versa
- remove f1, f2 can still access the data
- files must be in the same file system

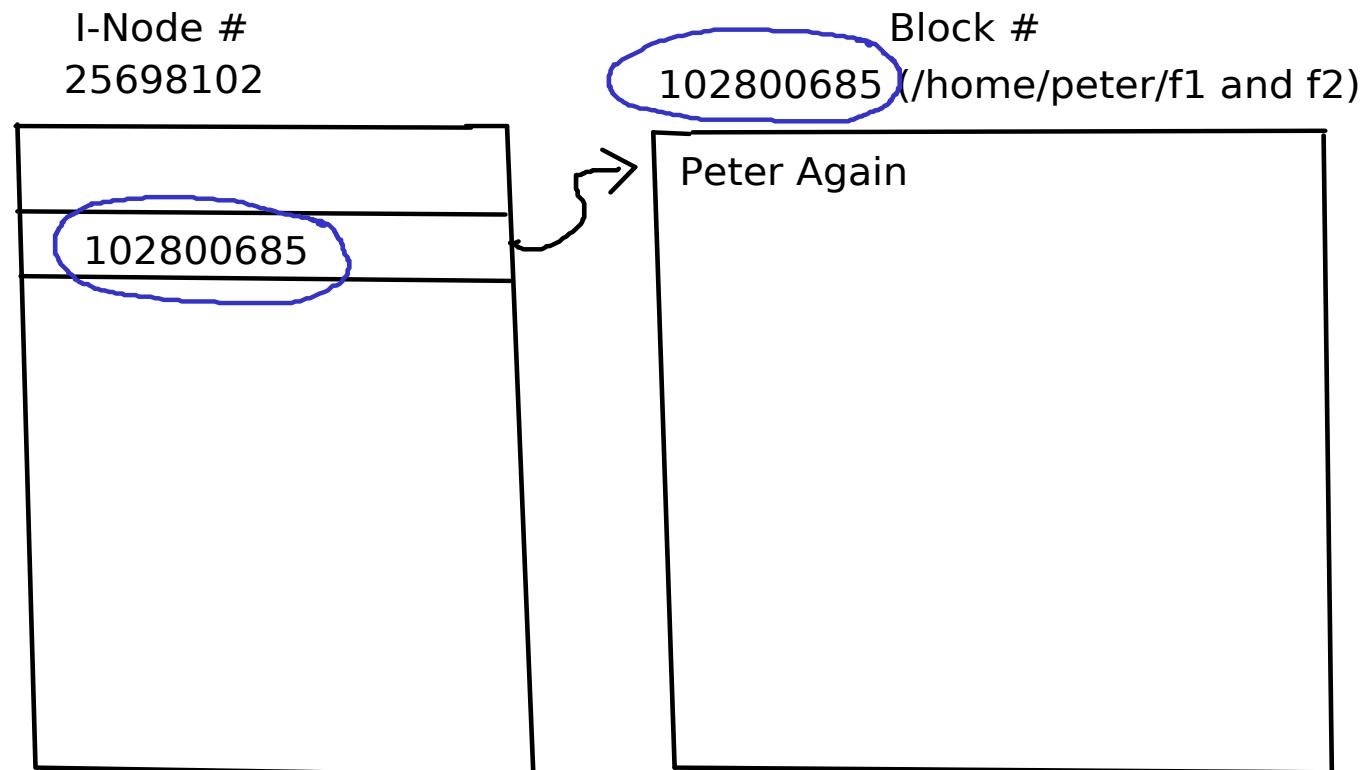

Access /home/peter/f1 And f2

- /home/peter I-Node

Access /home/peter/f1 And f2 cont.

Symbolic (Soft) File Links

- a file that contains a pointer to another file

```
# Assume ext4 file system on /dev/sda5 (Root File System)
```

```
# Assume ext3 file system on /dev/sdb2 (Thumb Drive)
```

```
peter@cobra:~$ echo "Peter Again Again" > g1

- modifications to g1 are reflected in g2
and vice versa
- remove g1, g2 can NOT access the data
- files may be on different file systems

Debug File System

- Enter Debug Shell (debugfs /dev/sdb2)

- debugfs: stat g2
